

(a) pairwise comparator

linear vs VP

5 of 12 cells invert

4 of 12 at every NFE
3 distinct R comparisons

R does not order W_2

(b) in-family objective

VP vs Chen Ex. 3.3 scalar

9 of 36 blocks invert

4 of 12 geometry×solver cells
both paths are shared (α, σ)

still not a ranking rule

(c) unconstrained minimiser

$$q_i(t) = \lambda_i^t$$

smallest in 36 of 36

smallest R and smallest W_2
not a shared interpolant for $d \geq 2$

R works as an objective
